WORKING INFORMATION

Mr Adelanwe,I hope your day was good.

Please the study title is as shown in the Google Form and attached documents. The study has ethical and institutional approvals, and data collection will use both online and paper questionnaires.

Please build the draft in the Google Form I own, using your editor access and the attached PIS, consent form and questionnaire, with these instructions:

1. **Preserve the instrument:** Retain the wording, question numbers, response options, recall periods and question order, including all items within tables. Flag ambiguities for my review rather than making independent changes.
2. **Sections and eligibility:** Present the PIS, electronic consent and questionnaire in clearly labelled sections. Apply the questionnaire's eligibility conditions, including the **24-month competition criterion**, and its stop and skip rules.
3. **Online consent:** Display all consent statements, followed by a required choice: **"I agree to participate" / "I do not agree to participate."** Neither option should be preselected. Only agreement permits continuation. Omit participant name and signature fields from the online questionnaire. In online question 0.6 only, replace "written informed consent" with "informed consent"; retain "written" in the paper version.
4. **Privacy and storage:** Disable email collection and respondent access to results summaries. Restrict access to the form and response spreadsheet to authorised team members. In the draft PIS, replace the Google Workspace storage sentence with: "Electronic responses will be stored in a password-protected, investigator-controlled Google account secured with two-step verification, and subsequently on an encrypted, password-protected computer."
5. **Study IDs:** Include a Study ID field. Actual codes will be assigned after sampling; use dummy codes for testing now. Prepare the form so IDs can be prefilled later, and demonstrate this to me. Do not retain a name-to-ID mapping in the response dataset or create one without discussing it with me.
6. **Combined dataset:** Link online responses to Google Sheets and provide a matching Excel template for entering paper questionnaires. Both sources must produce one combined dataset with identical variable names, column order and coding. Retain the Study ID and record collection mode as **Online** or **Paper**. Preserve original online responses separately.
7. **Codebook:** Map each variable to its questionnaire item. Give each table item its own variable. For multiple-response questions, use a separate variable for each option and a separate field for "Other" text. Distinguish unanswered items, skips, "Not applicable" and "Prefer not to say"; do not automatically treat these as "No" or zero. Document any scoring and missing-item rules.
8. **Checks:** Test eligibility, consent and all skip pathways. Enter several dummy paper and online questionnaires, combine them, check duplicate IDs, and confirm correct coding and successful import into SPSS/Stata.
9. **Review:** Send me the draft, codebook and paper-entry template for review and pilot testing. Include the approved support information. Flag any further wording adaptations or decisions needed, and await my approval before distribution
